Senior Full-Stack Engineer - Vehicle Diagnostics

Dear Hiring Manager,

I'm applying for the Senior Full-Stack Engineer role on the Vehicle Diagnostics team. Building systems that process real-world data and turn it into something useful for customers is the kind of work I find most satisfying.

In my current role, I've built APIs and microservices that handle insurance transactions at scale—1400+ policies in the first four months of launch. I've also worked on a medical AI platform where we processed diagnostic data and had to get results to clinicians quickly. Both required thinking carefully about data pipelines, observability, and what happens when things go wrong at 2am.

I don't have direct experience with vehicle telematics or IoT, but I'm genuinely interested in learning. The idea of working with firmware engineers to get raw vehicle signals into useful customer-facing products sounds like a fun problem. I've spent my career picking up new domains quickly, and I'd bring that same approach here.

I'm happy to discuss further.

Sincerely,

Tyler Kuipers
