REMOTE

Staff Developer

Dear Hiring Manager,

I'm applying for the Staff Developer role at E INC. The combination you're describing, deeply hands-on engineering plus technical leadership, is exactly how I've been working, and a real-time auction platform is an interesting set of problems.

My production JVM experience comes from Gosu, a Java-adjacent language that shares Java's type system and compilation model. I've been writing it since 2018 on a platform handling over \$300M in annual transactions. I own the architecture, set standards for a 12-person team, write the RFCs that get us aligned on the hard calls, and sit on an Architecture Steering Committee. I led a 2-3 engineer rewrite of a brittle legacy system into containerized microservices with Datadog wired in for visibility. Production debugging is something I take seriously: a cancellation bug nobody could reproduce got root-caused in days by replaying snapshotted production data against the system.

I've also used Elasticsearch for production monitoring at a prior role (Arterys), and I'm comfortable in AWS with a range of services.

Honest gaps worth naming: I haven't used Spring Boot in production, and I haven't worked with GraphQL. The JVM patterns and API design concepts carry over, and I ramp quickly. I'd rather be upfront than leave you to find it later.

I'd be happy to talk more.

Thank you for your time and consideration,

Tyler Kuipers
