REMOTE

Senior Software Engineer (P4)

Dear Hiring Manager,

I'm applying for the Senior Software Engineer role on the LMN pod. I like that you measure success by customer outcomes rather than pull requests, and building the software a landscaper runs their whole business on is the kind of concrete, this-matters work I enjoy. I've worked in a pod structure before too, engineers alongside a PM, design, and QA, so the way you've set this up feels familiar.

The most relevant thing I've done: I led a 2-3 engineer rewrite of a brittle legacy C# system into containerized .NET microservices. The old one had frequent outages and was painful to work in; the new one is measurable and maintainable, with Datadog metrics for failure rate, throughput, and timing so we could actually see how it behaved. Owning a service end to end, from the design doc through the part where it has to stay up, is how I like to work.

I lean on design docs to get a team aligned on the hard calls. One I'm proud of is an RFC to move us to trunk-based development with feature flags, so we could decouple deploys from releases and roll changes out gradually. I treat reliability as part of the feature rather than a follow-up: instrument what I ship, set clear bars, and follow through on what production teaches us.

On the AI side, I use coding assistants and agentic workflows every day, and I've got real opinions on where they speed things up and where they quietly add work. I'd be glad to help a team get good at using them well, with guardrails rather than blind trust.

Two honest notes. My frontend depth is in TypeScript rather than Angular specifically, and my cloud work has been on AWS rather than Azure. Neither has slowed me down much before. I ramp quickly, and the Azure side isn't far from what I already use, since I've worked with Azure DevOps and Artifacts. I'd rather be straight about that than oversell it.

I'd be happy to talk more.

Thank you for your time and consideration,

Tyler Kuipers
