REMOTE

Senior/Lead Backend Engineer (Remote)

Dear Hiring Manager,

I'm applying for the Senior/Lead Backend Engineer role at Fuse Energy. The specifics of what you're building, real-time pipelines for energy data, messaging interfaces with third-party providers, highly-available backend systems, are the kind of problems I find interesting and have been working on.

Most relevant: I architected Canada's first pay-as-you-go insurance product, 10 Lambda functions across multiple AWS accounts, processing 2.8 million insured trips at 99.9% uptime since launch. I also built an event-driven ingestion pipeline for an external partner: S3 ingestion, a Kubernetes CronJob, a translation service, and transactional API calls to a composite endpoint. I work in Terraform and Python on AWS, and I write the design docs that get a team aligned before we build.

I also built a self-service developer platform from scratch that replaced a 2-3 week manual provisioning process with a 2-hour one. When the right tool doesn't exist, I build it.

Honest notes: the energy sector is new to me, I'm coming from insurance. The engineering patterns look the same from where I'm standing, event-driven pipelines, third-party integrations, high-availability constraints, and I'd ramp on the domain quickly. Also: my IaC experience is Terraform, not CDK, though the concepts carry over.

I'd be happy to talk more.

Thank you for your time and consideration,

Tyler Kuipers
