REMOTE

Senior Software Engineer, Libraries Platform

Dear Hiring Manager,

I'm applying for the Senior Software Engineer role that you have posted. I strongly agree with the statement you made that a good platform is invisible. I was excited when I came across the opportunity for a job where you can build the tooling that other engineers rely on. This type of job really lets the challenging and interesting parts of the career shine through.

In the past, I've skirted around the edges of these types of problems. In my current role, I built out a CLI that allows our dev team to deploy test environments in an automated fashion, shortening our environment creation time from a multi-week process to one that takes 2-3 hours. I also created a helpful website that maps out these environments, allowing our product owner and QA teams to see which pieces of infrastructure are connected to each other (which front-end talks to which back-end, which cards are deployed where, etc). Increasing the speed and ease of my coworkers' jobs is a really fun endeavor.

I've also helped push our team towards modern development practices. In our case, that includes EKS, Terraform, Helm, GitHub Actions, Azure Artifacts, and Datadog, though I understand every team has its own preferred technology stack.

While I don't have any production experience in the Go stack, I have done a side project, hosting game servers on Kubernetes, that heavily uses Go. As well, I have experience ramping up quickly and love learning new things.

Alongside all this, I have both concrete management experience, from being a team lead, and soft leadership experience, more recently in my current role through RFCs, mentorship, and code reviews.

I would be very interested to meet and talk about the position more!

Thank you for your time and consideration,

Tyler Kuipers
