SUITE 200, 451 PHILLIP STREET
WATERLOO, ON N2L 3X2

Staff Software Engineer

Dear Hiring Manager,

I'm applying for the Staff Software Developer role at Auvik. The focus on staying hands-on while having technical influence across teams is very interesting to me. I have a passion for writing code, debugging hard problems, and building tools that make the team more effective.

Developer tooling is an area where I have had a lot of impact in my current role. I built a self-service platform that cut our environment provisioning process from 2-3 weeks to 2 hours. It's now used by 15 engineers across 3 teams, handling 15-20 environments per month: creating, destroying, deploying, and recovering from errors. Earlier in my career, I built a test framework for our system that reduced defects by 30% and is still in use team-wide 4+ years later.

I have run production systems on Kubernetes (EKS) and AWS with 99.9% uptime. I set up Datadog observability for our microservices: failure rates, latency, throughput. At my previous company, I used Elasticsearch and Kibana for production monitoring and caught issues before they hit customers, though I wasn't involved in setting it up. I enjoy digging across distributed systems to find root causes.

I don't have production experience with Go, Scala, or React. My stack is TypeScript, Python, and Java as of today. I learn quickly and have picked up new languages and frameworks throughout my career, but I want to be upfront about where my depth is.

Outside work, and on top of completing my Master's degree, I run a homelab on Kubernetes (TalosLinux) and have side projects including a mutation testing framework built on tree-sitter. I like staying sharp and building things that interest me.

I'd be happy to talk more about how my developer tooling and infrastructure experience could contribute to Auvik.

Sincerely,

Tyler Kuipers
