REMOTE

Senior Applied AI Engineer

Dear Hiring Manager,

I'm applying for the Senior Applied AI Engineer role. Vanta's problem is one I find genuinely interesting: security compliance is still mostly expensive manual work for the companies going through it, and automating the trust verification layer is a real unlock. My background is platform and backend engineering. I've spent the last few years at AMA building APIs, distributed systems, and developer tooling. Before that I was at Arterys, building the TypeScript and Node.js backend services that ran medical AI algorithms in production and returned results to the platform.

The TypeScript and Node.js stack is familiar. Arterys was TypeScript and Node.js throughout. At AMA I own several TypeScript REST APIs serving 5 internal teams and external partners, and I architected the backend for a pay-as-you-go product running 10 Lambda functions across multiple AWS accounts with 99.9% uptime since launch. I'm also strong in Python for data pipeline and Lambda work.

I haven't shipped an LLM-backed feature in a production company context, and I want to be straightforward about that. What I do have is daily hands-on experience with AI coding assistants and agentic workflows, to the point of having real opinions on prompting patterns, where agent loops are reliable, and where you need evals and guardrails before trusting the output. I've also built a side project using LLMs for stock market news analysis, which got me into the practical mechanics of integrating LLM APIs and thinking about output quality. The backend engineering skills that make LLM-backed products actually reliable at scale are things I've been building for years.

One other overlap worth mentioning: I've worked inside a SOC 2 compliant environment for the last three years. I understand what compliance monitoring looks like from the inside, which seems like relevant context for building what Vanta builds. I'd be happy to talk more.

Thank you for your time and consideration,

Tyler Kuipers
