REMOTE

Staff+ Software Engineer

Dear Hiring Manager,

I saw the posting on Hacker News and it caught my attention. While I've never worked in industrial process analytics, it is an intriguing problem set that I would like to spend time exploring.

My background is backend systems and platform engineering. Most of my production work is Java adjacent and on the JVM (via Gosu, a JVM language used by Guidewire), TypeScript, Node.js, and Python. At Arterys, a medical imaging company, I contributed to the Node.js and TypeScript backend services that ran their AI algorithms on clinical imaging data and returned results to the platform. I'm familiar with data-intensive backend with reliability requirements.

The craftsmanship emphasis in the posting resonated with me. TDD has been core to how I work since 2018. I designed a test framework that reduced defects by 30% on subsequent projects, got adopted by 15 developers, and is still running four years later. I also built a self-service developer platform solo that took environment provisioning from 2-3 weeks down to 2 hours because I think developer experience is part of the product. I fix bugs properly rather than working around them.

On the Staff side: I own the API contracts for a 12-person team, write the RFCs that get the team aligned on hard architectural calls, sit on AMA's Architecture Steering Committee, and mentor developers through code reviews and legacy codebases. I'd be happy to talk more.

Thank you for your time and consideration,

Tyler Kuipers
