REMOTE

Staff Software Engineer - Platform

Dear Hiring Manager,

I saw this on Hacker News and it caught my attention. Platform engineering is the bulk of what I spend my time on, and the work you're describing maps closely to what I've been building.

The developer platform story is probably the clearest overlap. I built a self-service infrastructure platform solo at AMA that took environment provisioning from 2-3 weeks down to 2 hours (60x): environment create/destroy, database snapshots, pull-from-prod, ADO metrics integration. Fifteen people across 3 teams use it and it spun up 120+ environments in 2025. I also own 4 REST APIs serving 5 internal teams and external partners, design the contracts and versioning strategy, and maintain API design standards across the team.

On the infrastructure side: AWS is my home cloud. Lambda, EKS, S3, SQS, IAM, Aurora/RDS across multiple AWS accounts. I deployed a production EKS cluster running cert-manager, Datadog, Karpenter, Linkerd, and microservices, packaged with Helm. I write the RFCs that align teams on hard architectural calls and sit on AMA's Architecture Steering Committee.

One thing worth being upfront about: I haven't built multi-tenant systems in production. My AMA work is internal and single-tenant. That said, I've been reading up on isolation approaches (schema-per-tenant, row-level security, dedicated databases) and I think I understand the tradeoff space well enough to reason about the right approach for a given context. I'd be happy to talk more.

Thank you for your time and consideration,

Tyler Kuipers
