REMOTE

Senior Software Engineer (Java / AI-Enabled)

Dear Hiring Manager,

I'm applying for the Senior Software Engineer role at Rocket Financial. Payments and financial infrastructure is a domain I'd like to grow into, and the combination of hard backend problems with explicit AI tooling makes the role stand out.

My production JVM experience comes from Gosu, a Java-adjacent language that compiles on the JVM and shares Java's type system and idioms. I've been writing it since 2018 on a platform that processes over \$300M in annual insurance transactions. Alongside that I've built microservices in Python and TypeScript on AWS Lambda and EKS, owned 4 REST APIs serving 5 internal teams, and architected Canada's first pay-as-you-go insurance product: 10 Lambda functions, 2.8 million insured trips processed, 99.9% uptime since launch.

On the AI side: I use Claude Code and Cursor every day. I've gotten specific about what they're actually good for (iterating in unfamiliar domains, test scaffolding, boilerplate) and where they create drag (complex refactors, subtle business logic). I think helping a team build real habits around AI tools is one of the more valuable things a senior engineer can do right now.

Worth naming up front: I haven't used Spring Boot in production, and my frontend experience is TypeScript, not specifically React. Neither has stopped me before.

I'd be happy to talk more.

Thank you for your time and consideration,

Tyler Kuipers
