Software Developer III

Dear Hiring Manager,

I'm interested in the Software Developer III opportunities you're matching for. Better-fit introductions and a record that follows the work you've actually done is a refreshing take on all this, and I'd be glad to be in the mix for enterprise and cloud roles.

Most of my work for the last few years has been backend and API development on an enterprise platform. I own four REST APIs that internal teams and external partners build against, so I spend a lot of time on the things that keep an API safe to depend on: clear contracts, versioning that doesn't break callers, and design standards I can point people to. OO design and the usual patterns are how I structure things, and I lean on Postgres for the data underneath.

I care about the parts of the job that don't show up in a demo: scalability, reliability, and tests you can actually trust. I led a small team rewriting a brittle legacy system into containerized services on Kubernetes, I work across AWS, and I've built the CI/CD pipelines that ship it all. Earlier on I built an automated test framework that cut defects by 30% on later projects, and the team is still using it years later.

I do well working independently, but there's a lot of collaboration in how I work too: code reviews, RFCs, architecture discussions, and mentoring newer developers. I also just like picking up unfamiliar tools, which is most of why I've stuck with this field for ten years.

I'd be happy to talk more about where I might fit.

Thank you for your time and consideration,

Tyler Kuipers
