REMOTE

Senior / Staff Software Engineer

Dear Hiring Manager,

I'm submitting my application for both the staff and senior software engineering roles you have posted. I am interested in moving towards the healthcare space as I want to build products that help people. I have 10 years working in the industry with most of those being backend focused. More recently, I have been working in a Senior Software Engineer/Architect role within Alberta Motor Association's insurance department for the past 3 years, gaining experience in Gosu (a Java-adjacent language on the JVM), Python, EKS, and AWS.

I have built and maintained many different REST APIs relied on by both internal and external teams. One worth noting is our trip intake pipeline for our pay-as-you-go insurance product. It is an AWS-first architecture that employs Lambdas, cross-account S3, REST, among other components. This platform has maintained a 99.9% uptime since launch and won us an industry award. More recently, I rewrote our document rendering solution from a legacy .NET system into a microservice architecture now hosted on EKS.

While I have no direct reports, I help lead the department primarily through soft forms of leadership. This includes: writing RFCs, sitting on our organization's architecture steering committee, mentoring developers through code reviews and pair programming. I'm currently helping the team adopt feature flags and trunk-based development, for example.

While I'm not familiar with React and Next.js, I am a quick learner and am excited to discuss this role with you.

Thank you for your time and consideration,

Tyler Kuipers
