Lead Engineer

Dear Hiring Manager,

I'm applying for the Lead Engineer role. Building analytics for community health centers, and pointing it at the organizations working to close health gaps, is the kind of work I'd be glad to commit to for the long run. The mission is most of why I'm writing.

I spent a year at Arterys building and maintaining backend services that ran medical AI algorithms and returned results to a medical-imaging platform. It's the closest thing to what you do that I've worked on, and getting back into healthcare is the part of my career I've been wanting to return to.

For the last three years I've been the software architect at AMA, and a lot of the role is what you describe under technical stewardship. I lead architecture proposals, write the RFCs and design docs behind them, run deep code reviews, and work to keep our abstractions clean as the product grows. I mentor a 12-person team and sit on our Architecture Steering Committee. I also like the writing side of the work, which it sounds like you do too.

TypeScript is home territory for me. I've also spent a bit of time with Rails and Go on side projects, so the rest of your stack isn't foreign, and I pick up unfamiliar tools quickly.

I work well with a lot of autonomy and little ceremony. On my own I built a self-service developer platform that took environment provisioning from two to three weeks down to two hours, the kind of tooling improvement you mention wanting. I'm comfortable owning a problem end to end and managing my own priorities.

I'd be happy to talk more about the role and where I could help.

Thank you for your time and consideration,

Tyler Kuipers
