REMOTE

Senior Software Engineer (WMS)

Dear Hiring Manager,

I'm applying for the Senior Software Engineer role at Cozey. Building software that makes a physical thing show up at someone's door on time is more concrete than what I've been building, and that kind of end-to-end accountability is what I find interesting about it.

My primary languages are TypeScript and Python, and I've spent the last three years owning REST APIs end to end at a company with over \$300M in annual transactions: design, OpenAPI contracts, versioning, and everything that breaks after launch. On the tooling side: I built a self-service internal platform from scratch that replaced a 2-3 week manual provisioning process with a 2-hour one. 15 people across 3 teams actually used it. Building in-house solutions instead of bolting together third-party tools is how I prefer to work.

Testing has been part of how I work since early in my career. I designed a test framework that reduced defects by 30% and is still running on the team today, 4+ years later. TDD isn't something I advocate for; it's just how I write code.

On the AI side: I use Claude Code and Cursor every day. Using AI to automate warehouse workflows is exactly the kind of operationally concrete work I find interesting.

One honest note: WMS and logistics are new domains for me. I'm coming from insurance. The engineering problems look familiar, event-driven pipelines, API contracts, internal tooling, and I'd ramp on the domain quickly.

I'd be happy to talk more.

Thank you for your time and consideration,

Tyler Kuipers
